P. Allen Smith GARDEN HOME

Measure out the area you'd like to cover. Decide your height to requirements and then add a few inches to account for the depth in the soil. For example, I wanted my trellis 5 feet tall, so I cut three pieces 64 inches in length for the height. Then stick them in the ground and measure the distance between them. That's the length of your 4 horizontal pieces. Using screwdriver or screwgun attach horizontal to verticals, making two squares.

Place in the ground again. Consider adding shorter pieces to reinforce where the squares meet. Tie hemp rope to bottom supporting piece. Then loop around top and bottom until you reach the next vertical piece. Tie off and start again on the second square. Voila! A space-saving place for plants to grow.
